ABOUT THE CONFERENCE

Skin cancers like melanoma, squamous, basal and other variants, comprise the most common group of cancers and can be among the most challenging to treat. They are also some of the most preventable cancers. San Diego County’s incidence rate is on the rise with over 850 new melanoma cancer cases diagnosed each year. The opportunity for education and discussion is timely and advantageous in addressing this growing threat. This conference is for primary care physicians, specialists, and interested healthcare professionals.

EDUCATIONAL OBJECTIVES

Following the conference, attendees should be able to:

• List different strategies for skin cancer prevention
• Identify populations at risk for skin cancer and appropriate surveillance strategies for early detection
• Describe characteristics of suspect lesions and biopsy approaches for appropriate evaluation and staging
• List treatment considerations for basal and squamous cell cancers
• Describe adequate clinical evaluation and staging of melanoma, and latest developments in treatment strategies
• Recognize appropriate surveillance measures for skin cancer survivors in the primary care setting
